

SA-26 INDEPENDENT BRAKE VALVE

Revised Lubrication Requirements

OCTOBER, 1996

This Service Bulletin is being issued to revise certain lubrication procedures for the SA-26 Independent Brake Valve done at certified air brake shops. The appropriate Operation and Maintenance Information will be revised accordingly.

Lubricant:

1. Spindle Grease. "Tufoil" brand high temperature spindle grease, a product of Fluoramics Inc., 18 Industrial Avenue, Mahwah, New Jersey, 07430-2208.

Note 1: IMPORTANT. Care must be taken to prevent any application of spindle grease to the O-rings, O-ring grooves, and O-ring bearing surfaces. **The existing Operation and Maintenance Information requirements for O-ring lubrication remain the same.** The O-rings, O-ring grooves and O-ring bearing surfaces must be lubricated with Number 2 Silicone Grease, Wabtec Corporation Specification M-07680-02, such as Dow Corning Corporation, Dow Corning #55.

Note 2: IMPORTANT. Extreme care must be taken to prevent lubricant of any kind from being applied to either the outside diameter of the cam dog roller where it contacts the cam, or the area of roller contact on the cam itself. The contacting surfaces of both of these parts must be maintained clean and dry to retain rolling friction which will prevent any sliding action.
